# Using Golang for implementation of a concurrent and distributed realtime processing system.

BY

#### CHAI YING HUA

SESSION 2017/2018

THIS PROJECT REPORT IS PREPARED FOR

FACULTY OF COMPUTING AND INFORMATICS
MULTIMEDIA UNIVERSITY
IN PARTIAL FULFILLMENT

FOR

BACHELOR OF COMPUTER SCIENCE (HONS)
WITH SPECIALIZATION IN
SOFTWARE ENGINEERING
FACULTY OF COMPUTING AND INFORMATICS

MULTIMEDIA UNIVERSITY

SEPTEMBER 2017

The copyright of this thesis belongs to the author under the terms of the Copyright Act 1987 as qualified by Regulation 4(1) of the Multimedia University Intellectual Property Regulations. Due acknowledgment shall always be made of the use of any material contained in, or derived from, this thesis.

#### Declaration

I hereby declare that the work in this thesis have been done by myself and no portion of the work contained in this thesis has been submitted in support of any application for any other degree or qualification of this or any other university or institute of learning.

Name: Chai Ying Hua Student ID: 1141328508

Faculty of Computing & Informatics

Multimedia University Date:  $1^{st}$  August 2017

#### Acknowledgements

The success and outcome of this project require tons of guidance and assistance from many people, and I am blessed and appreciate to have got this all along the completion of my project. My project would not be complete smoothly without their helping hands.

First and foremost, I would like to express sincere gratitude to my project supervisor, Mr Wan Ruslan Yusoff of Faculty of Computing Informatics at Multimedia University Cyberjaya for your unfailing support and assistance on my project. The door to Ruslan office and his mailbox was always open whenever I faced any impediment and trouble about my project or writing. He consistently and patiently steered me in the right direction whenever he thought I needed it. Also, he is eager to share his expertise and industrial experience in computing fields and provide encouragement and motivation on my project.

I owe gratitude to my parents for providing chances and opportunity for me to study in Multimedia University. They are caring, and concern about my academic and regularly provide support and attention on cultivating me to get myself prepare for an upcoming challenge.

Last but not least, I place on record, my sense of gratitude to my friend and classmate, who directly and indirectly unceasing encouragement and provide guidance till the completion of my project.

WIP Work In Progress

The project focuses on a comparison of concurrent programming language concepts and their expressive power on data processing with concurrent and distributed computing.

The research draws attention to compare Go and Rust programming language, these languages' paradigm, characteristic and focus are further discussed. Big data are obtained with data collection and tested with Devil Advocate to uncover quality and logical weakness in data contents. Moreover, large datasets are stored and handled by PostgreSQL database, an Object-Oriented Relational Database Management System (OORDBMS).

Several programs are developed as prototypes to prove concurrent programming implementation on data parsing and data retrieval from raw data and PostgreSQL database. Benchmarking is conducted to obtain accurate processing results from the comparison of language execution.

Results of the project show Golang program possess supportive packages and build-in library to parse data in streams and perform data retrieval from Post-greSQL database. Several commands and query are executed and uncovered data content weaknesses and vulnerabilities.

The prototypes successfully prove concurrent programming has better performance and throughput compare to sequential. Data duplication, incorrect data types and content completeness can be identified with testing. All program and execution can be found in Appendices. It is recommended that GORM library should be used for migrating data to enhance maintainability and integrity. Benchmarking shall be improved by unified hardware resource usage during program execution.

### Chapter 1

### Introduction

#### 1.1 Introduction

In a globalization and modernization era, the volume and variety of big data continue to increase at an exponential rate. Cloud computing environment such as IBM, Microsoft Azure, GCP and Amazon AWS possess great shifts in modern ICT and robust architecture to perform large-scale and complex computing service for enterprise applications.[1] Chip makers AMD, IBM, Intel, and Sun rapidly building chips with energy-efficient multiple processing cores that improve overall performance by handling more work in parallel for server, desktops and laptops. [2] The performance and availability of system required to increase dramatically with the inclusion of Multiprocessing and Multi-computing.

The trends of computing industry diverged towards distributed, low cost and high unit volume product. [3] Software development activities are consistently working on improving efforts in development and deployment activities by

solving issues, challenges and problem regarding concurrent and distributed computing. With the advent of client/server focus; massive cluster and networking technologies, the advancement of technology reveal problem and constraints on linguistic issues to the developer. [4] Availability of inexpensive hardware has to exploit various possibilities in the construction of distributed system and multi-processors that were previously economically infeasible. [5]

Software application today is inherently and expanded into concurrent and distributed computing with real-time applications. [6] In concurrent computing, processors or thread may have access to shared memory to exchange information between processors. However, processors in distributed computing possess its private memory for communication. [7]

Majority of systems language not designed with all these factors in mind and software users and a load of request gradually increase. Google decided to fork-off and rewrite their large production system to solve compile time and string processing by inventing a language that design for quick compilation without dependency checking. [8]

Go is free and open source programming language created by Google at 2007 and announce on 2009 [9] with two compiler implementation, GC and GCCGO. [10] The language were designed for high-speed compilation, support for concurrency and communication, and efficient or latency-free garbage collection. It is C-like and statically typed language that compiles into single binary with go compiler to reduce compile time. Go allow developer to model problems with a random order of events, optimize data operations, and utilize parallel processing of machines and network with concurrency programming. [11]

Go is an excellent language that possesses wide range of applicability. It has generous support for concurrency and exploits multi-core with goroutines and channels. Other than that, it owns garbage collector as the language automatically freed memory and resources after utilized the memory. [12] It's simplicity with standardized formatting and naming through several built-in packages with minimalistic language makes the code readable and maintainable. [13]

In this paper, we are going to focus on utilizing concurrent programming and distributed programming concepts of RUST and Go language. We will conduct a head-to-head comparison of RUST and Go in every individual perspective including performance. This paper doesn't contain the purpose of taking account in the development of concurrent logic language, but it attempts to expose important concepts of these languages and conduct a comparison for the use of self-study material and propose an evaluation scheme.

#### 1.1.1 Project Brief Description

We will use the Go programming language (Go or Golang) and Rust programming language to process a combination of static and time series data on multiple clients on a network that represents a real time, concurrent and distributed processing system. For this application, we will define the entire processing topology, covering the key concepts and elements of data sources (inputs), data processors (program filters/codes), and the data outputs. This topology is analogous to the Apache Storm processing topology that defines "spouts" as data sources and "bolts" as data processors. [14]

The application process mash-up of two unambiguous, free and informed consent data sources in a stream and produce meaningful information with the concepts, elements and ideas of Go and RUST language features on Ubuntu 16.04 LTS operating system.

The UK Company Profile Data, UK Longitudinal Education Outcomes (LEO) data and UK National Statistics Postcode Lookup (NSPL) data are handled by PostgreSQL, an object-oriented relational database management system. These data are processed by program written with Go language and Rust language to conduct language performance comparison and obtain useful information. Further conclusions and inference can be drawn from output to identify the expressive power and concepts of language.

#### 1.1.2 Project Objectives

The objectives of this project are:

- 1. To learn and understand about Go and RUST programming language concepts and their concurrent processing features.
- 2. To explore different techniques on data processing, concurrent and distributed programming for big data.
- To conduct performance comparison between Go and Rust language implementation in data processing with concurrent and distributed programming.
- 4. To conduct a comparison on Go and Rust concurrent programming language concepts in processing big data with different techniques.
- 5. To implement the handling of big data with PostgreSQL, an object-oriented relational database management system (OORDBMS).
- 6. To process combination of data on multiple repositories on a network that represent real time, concurrent and distributed processing system.

#### 1.1.3 Project Motivations

During my involvement and participation of industrial training in JobStreet.com (A SEEK ASIA Company), my colleague often discuss about Golang implementation in worker thread with session on server side scripting to handle concurrent request and reduce web server loads. In Tech Talk Thursday with Grab Singapore organised in MMU Cyberjaya in January, the speaker mentioned the companies use Go language as tool to build their backend on handling request. Indirectly, the discussion and seminar by technical professionals stimulate my curiosity on capabilities and usage of golang.

In my process of exploration, I had attended several Golang meetups and learning sections in Kuala Lumpur. I am impressed the new language helps company saving cost on building servers and running well in small hardware specs. Other than that, I had discovered various notable company and sites start migrated their essential services and critical component from other languages to Go. Within several years, Google's Go language has gone from being an unfamiliar language to well-known promising tools or significant source for a big technology company to develop fast-moving new projects.

As Go soared to a new height in Tiobe programming language popularity, it has inspired me to gather more information and knowledge regarding the capabilities of the language. After viewing online articles and journals, I had discover this concurrency-friendly programming language may be the future of development, and it stimulates my passion and excitement for learning the language.

Simultaneously, I notice this project was published as FYP title in this semester. Without any hesitation, I am exhilarated to pursuit and register this

project in my final academic year in order unveil the capabilities of golang. It will be enjoyable and great to learn this language throughout the project.

#### 1.2 Project Scope

#### 1.2.1 Phase 1 Scope of Work

- 1. Research project interest and raise question in different categories of data repositories.
- 2. Setup boot partition for Ubuntu 16.04 LTS operating system with Window 10.
- 3. Install Go language compiler and RUST language compiler on PC.
- 4. Install Eclipse for Parallel Application IDE.
- 5. Install Goclipse and RUST GUI into Eclipse IDE.
- 6. Install Terminator application into Ubuntu; it is an application that produces multiple terminals in a single window so that developer can perform various task in a single environment.
- 7. Install Synaptic Package Manager that enable upgrade and remove software package a user-friendly way without dealing with dependencies issues.
- 8. Set up PostgreSQL into PC for big data handling.

#### 1.2.2 Project Deliverables for Phase 1

- Acquire free, consent and big UK's basic company data published by Companies House in data.gov.uk that containing basic company data of live companies on the register for data processing.
- 2. Acquire institution subject data published by UK Higher Education site and create a mashup in a project which works with two sets of data and process them to provide output.
- 3. Acquire postcode data for UK location as the linker of basic company data with institution subject data.
- 4. Develop a proof of concepts and understanding on concurrent and program with Go language.
- 5. Write Go code for serial and concurrent programs which able to process raw CSV data and PostgreSQL database.
- 6. Conduct comparison on sequential and concurrent programming with Go programming language.
- 7. To implement LTTng (Linux Trace Toolkit Next Generation) to monitor the performance problems on concurrent and distributed real time system written with Go and Rust programming language.
- 8. Use CTF Trace Compass to read the outcomes for produce and present analyses of results.

### Chapter 2

### Literature Review

#### 2.1 Literature Review

# 2.1.1 Sequencial Programming vs Concurrent Programming

Sequential programming involves process execution one after another [15] and have no linguistic design construct for concurrent computations. [16] The processes will only run after other is successful and executed chronologically in predetermined manner. [17] However, it's difficult to implement complex interaction and handle problems in parallel and concurrent environments with single-threaded. [18]

Concurrency had cause major turning point force in software development for developing concurrent software in order to exploit greater efficiency and performance optimization by fully utilize hardware resources with multiple chips. To leverage the full power of hardware resource in software industry, concurrency and clouds will be the things every developer requires to deal with in future software development and it is essential for both concurrent and distributed system. [19] Future generation computing system likely being developed by concurrent computing or programming on multiprocessors. [20]

#### 2.1.2 Concurrent Programming

Concurrent programming is form of computing where two or more processes or threads cooperate to achieve common goals with multi-threading, inter-process communication and synchronization without require multi-processors. [21] Implementing concurrency into system requires imperative and functional language which allow programmer to take in control of concurrency by specifying step-by-step changes to variables and data structures in manipulation of data. [22] Therefore, concurrent programming language possess the ability to enable express concurrent computation easily by making synchronization requirements achievable and facilitate parallelism. Moreover, concurrent programming language possess programming notation, package and techniques for expressing potential parallelism and solving resulting synchronization and computer system communication problems. [5]

#### 2.1.3 Distributed Programming

Concurrency and distributed programming often discuss together on implementing for a wide application of computer platforms from mobile devices to distributed servers. Distribute programming is form of computing where various source of parallelism running program on multiple machines simultaneously. It allow a distributed server make efficient use of network resources to communicate and coordinate in order to provide closer service for clients. [23] Concurrent programming is used to implement distributed process for real-time applications operate by microcomputer networks which possess distributed storage. The concurrent program is implemented into distributed server or storage in order to execute sequential processes simultaneously. Concurrent Pascal is possible to satisfy the efficiency, reliability and consistency of distributed storage. [24]

#### 2.1.4 PostgreSQL

PostgreSQL is general object-oriented relational database management system that first possesses MVCC feature before Oracle. It supports various concurrent programming language such as C, C++ and Java, etc and guarantees data consistency while performing concurrency transaction. [25] PostgreSQL store multiple version of records in the database by keeping the latest version of tuple and garbage collects old records no longer required with both attribute xmin and xmax. [26]

In addition, PostgreSQL had implemented with TelegraphCQ data flow system for processing continuous queries in data streaming environment. Research has found the open source database system possess extensibility feature and reusable component to improve adaptivity and concurrent read-write. [27] Ultimately, PostgreSQL is used to optimise pipeline on handle runtime update request for conventional data warehouse to process data analysis concurrent queries efficiently. The database system offers a modern feature to support adaptive query processing and maximise work sharing during execution. [28]

#### 2.1.5 Go language

Go's principle focus on simplicity, orthogonal, succinct and safe to provide its expressiveness to support efficient large scale programming, faster compilation speed and utilized multi-core hardware. [29] In the past, Go had been used to implement high-performance, scalable radio access system to evaluate its suitability and language functionality. [30]

The language had also utilized to assess text data processing in information system and mentioned Go is promising featuring native support for distributed applications. [31] Ultimately, Go's concurrency primitives is used to implement an artificial intelligence and graph theory based sliding-puzzle game for Unix terminals. The language concepts and package are supportive to developed real-time notification delivery architecture with its goroutines. [32]

#### 2.1.6 Rust language

Rust is a new and multi-paradigm programming language developed by Mozilla Research. [33] Earlier projects were using the Rust programming language to built several higher level abstractions on GPU kernels. They show how Rust advanced features enable to support both system-level concept and high-level operators on GPU computing. [34] Small model of RUST called Patina was experimented and study for claiming the language memory is safety without garbage collection by identify whether there are leaks during deallocating memory and ensure data initialized correctly on the runtime memory. [35]

# 2.1.7 Comparison of concurrent programming language concepts

Experimental design and demonstration are conducted by the previous researcher to compare concurrent programming languages concepts with debugging existing programming and writing correct new programs. [36] Structure embedding concepts of several concurrent programming languages examined by demonstrating mapping to a parallel composition to test its expressive power of these languages through results. [37]

Moreover, a general method is developed by previous research for comparing concurrent programming languages based on categories of language embeddings to obtain separation results. Properties of language affecting the concept and performance of concurrent programming language. As an example, even though CSP and Actors possess common characteristic with non-compositional

observable equivalence and interference free but CSP contains composition with hiding while Actors doesn't. [38]

In addition, expressive power of concurrent programming languages often compared by previous research to investigate how synchronization and logical control construction affect the efficiency of resulting word from three computational model. [39] Several conventional techniques and concurrent programming structures were analyse for implementing concurrent objects related to critical sections with concurrent programming languages. [40] Furthermore, previous researchers had proposed classification frameworks to study relevant elements of architecture description languages by present definition for comparing language components, connectors and configurations. [41]

Concurrent programming can achieve remarkable performance successfully with concurrent programs that scaled into multiple computers. [42] Surveys is conducted on a preference of design and language features found in 13 concurrent languages and found available architectural supports profoundly influence the language's style. [43] Previous research is conducted to compare implicit and explicit parallel programming with SISAL and SR to evaluate for programmability and performance. [44] Detailed performance measurements are presented with the comparison of various parallel architecture and measured with Beowulf-class parallel architecture. [45]

#### 2.1.8 Comparison of Go and Rust language

Go and RUST has start to gain popularity among the trends. [46] Rust and Go are also some of the developers most loved programming language. [47] The Rust and Go programming languages are new programming languages for implementing concurrent and distributed based system. [48]

Go and RUST are both new concurrent programming language create after the year 2000. Go had become language of the year in Tiobe programming language ranking in 2009 and 2016. [49] Simultaneously, Rust won first place in most love programming language in Stack Overflow survey 2016 and 2017. [50]

Both concurrency programming languages support functional and imperative procedural paradigms. [51] [52]. Go is a CSP-based language provide rich support concurrency with goroutines and channel [53] but Rust is an actor model language focus on memory safety over performance. [54] Go and Rust often used to be compared with current software industry in concurrent computing implementation. [55]

Figure 2.5 shows characteristic and paradigm of Go and RUST programming language. All the language characteristic below will be discussed in the following subsection.

| Language        | Go   | Rust                                   |
|-----------------|--|--|
| Categories      | Communicating Sequence Process (CSP), High-level | Actor Model, Low-level                 |
| Focus           | Simplicity, Concurrency, Efficiency              | Memory Safety, Concurrency, Security   |
| Intended Use    | Application, games, web, server-side             | Application, System                    |
| Imperative      | Yes  | Yes                                    |
| Multi-paradigm  | Yes  | Yes                                    |
| Object-oriented | Yes  | No                                     |
| Functional      | Yes  | Yes                                    |
| Procedural      | Yes  | Yes                                    |
| Generic         | No   | Yes                                    |
| Reflective      | Yes  | No                                     |
| Event-driven    | Yes  | No                                     |
| Failsafe I/O    | Yes (unless result explicitly ignored)           | Yes (unless result explicitly ignored) |

FIGURE 2.1: Comparison of Go and Rust language characteristic

#### 2.1.8.1 Comparison of language categories and focus

Go is a high-level language focus on simplicity, reliability and efficiency. The language designed with communicating sequential process (CSP) to express concurrency based on message passing channels. The processes and messages communicate via goroutine and gochannel within a shared memory. [56] The language is intended to use for building web application programming interface (API) or networking application such as TCP or HTTP server to handle request.

Go possess simple syntax, garbage collector and runtime which allow developer to increase code readability and implement concurrency easier. However, Go is lack of language extensibility which leads to a limitation on implement manual memory management. [57]

Rust is a low-level language focus on memory safety, security and fault tolerance. The language designed with actor model concurrent programming language that use "actors" as fundamental agent on message passing. The actor takes input, send output after performing functions. [58] The processes and message communicate point-to-point via actors in a consistent state. The language intended use for system programmings such as building game engines, driver and embedded devices.

Rust doesn't possess garbage collection and runtime which promote extensibility and deterministic on implement memory management. [59] However, Rust has much inherent complexity of syntax and semantics and has a high learning curve for a developer.

#### 2.1.8.2 Similarities of Go and Rust language

The similarities of both languages are discussed as follow:

- 1. **Imperative.** Go and Rust are imperative programming paradigm where a value can be assigned into a variable to perform operation on information located in memory. Moreover, these languages allow declaration of a variable to store the results in memory for later use, affect the global state of a variable.
- 2. **Functional.** Go and Rust language can be written with mathematical functions to express control flow by combining function calls. The function avoid changing global state of variable.
- 3. **Procedural.** Go and Rust language can be written into statement structured and divided into function. The function known as procedure takes input processes it and produces output.
- 4. **Multi-paradigm.** Go and Rust language are support various programming paradigm and provide developer to use suitable programming style to develop a program to achieve project objectives.
- 5. Failsafe I/O and callbacks. Go and Rust language compiler warn error or throw an exception if the system calls fail. Go language throw errors if developer doesn't use the declare function or variable and Rust language does not compile if found any dangling pointers.

#### 2.1.8.3 Difference between Go and Rust language

The difference between both languages are discussed as follow:

- 1. **Object-oriented.** Go language support object-oriented programming with struct and interface. However, Rust is not an object-oriented language result of the idiomatic language and its appearance in an OO language. [60]
- 2. **Generic.** Go language is lack of generic where the compiler doesn't allow declared a function or variable written in to-be-specified-later types await to be instantiated when needed for a specific purpose. However, Rust is possible to specify generalized function and avoid codes rewriting.
- 3. **Reflective.** Go language possess the ability to observe and modify type, object, function execution on runtime by import "reflect". However, Rust doesn't have reflection.
- 4. **Event-Driven.** Go is a high-level language enable write application respond to demand and expectation from mobile devices, multicore architectures and cloud computing environments. However, Rust is a low-level language prevent the flow of program interrupt by an event from user actions to enforce security and safety.

#### 2.2 Chapter Summary

The finding for literature review is concurrent programming language possess specific built-in notation, package and functions to build parallel and distributed application. PostgreSQL is suitable for this project because it possesses MVCC that able handle concurrent request with good adaptivity and accuracy. Golang and Rust are concurrent programming language support multi-paradigm programming with multiprocessing and multithreading. Go language focused on simplicity while Rust language focuses on security. Both programming languages invented with different model and concepts for a different purpose.

Concurrent language is often compared and evaluated with configuration, categories and architecture to obtain performance and expressive power. The language's efficiency is essential to prove the performance of specific concurrent language. Debugging tools play a main role on observing processes and threads activities during the development and debugging activity to ensure the program's execution behavior is observed.

# Chapter 3

# Project Design

### 3.1 Introduction

The primary focus of Phase 1 is implement prototype to prove theoretical concepts of the domain to research in this project. Requirements are listed as follow:

- 1. To acquire free large data set for big data processing.
- 2. To ensure data set acquired from the website are free, consent and clean with Devil Advocation Test.
- 3. A program will be implemented in RUST and Go programming language as a proof-of-concept (POC) that CSV raw data is capable of importing into PostgreSQL database.
- 4. A program will be implemented with Go programming language as POC that PostgreSQL database transaction can be sequential and concurrent.

- 5. A program will be implemented with Go programming language as POC that reading CSV files can be sequential and concurrent.
- 6. To ease the debugging and troubleshooting on concurrent and distributed development environment, LTTng tracing network and Eclipse Trace Compass will be installed to obtain a reading and outputs traces via Common Trace File (CTF) binary format.

## 3.2 Project Resources

# 3.2.1 Acquisition of free public data set for data processing

The project is required to work with large data sets to utilize infrastructure and processing power of GO and RUST concurrent programming language. Data collection is conducted to identify of company recruitment preferences on higher education graduates of different subjects in the UK with basic company and LEO datasets. Data collected is required to be clean and able to solve interesting problem or question. The free, consent and licensed data sets acquired from UK government website provider (data.gov.uk) are as follow:

- 1. Longitudinal Education Outcomes (LEO) datasets published by Department of Education in CSV format with 160 thousand records.
- 2. **Basic Company datasets** published by Companies House in CSV format with 4 million records.
- 3. National Statistics Postcode Lookup (NSPL) datasets roduced by ONS Geography in CSV format.

The file format of large dataset obtained are Comma Separated Values (CSV) format which the information is organized with one record as one line and each field is separated by comma (,). CSV format is used for data processing in this project because it is human readable and simple to be parse. It can be handle easily using PostgreSQL database and easy to be read by programs.

#### 3.2.1.1 Longitudinal Education Outcomes (LEO) dataset

The data set focus on employment and earnings outcome of Bachelor's Degree graduate in Great Britain after five years. It contains information about students include personal characteristics, education or qualification achieved, employment and income earnings. The longitudinal education outcome data dictionary is created and shown below:

#### Longitudinal Education Outcomes Data Dictionary

| Data                 | Data Type    | NULL              | Description  |
|----------------------|--------------|-------------------|--|
| UKPRN                | int          | NOT NULL          | UK Provider Reference Number.  |
| providerName         | varchar(100) | NOT NULL          | University name that provide the subject   |
| Region               | varchar(50)  | NOT NULL          | UK Region  |
| subject              | varchar(50)  | NOT NULL          | Subject studied.   |
| sex                  | varchar(30)  | NOT NULL          | Sex of graduate.   |
| yearsAfterGraduation | int          | NOT NULL          | Number of years after graduation.  |
| grads                | int          | NULL DEFAULT 0    | Number of graduates included in calculations.  |
| unmatched            | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates that have been classed as unmatched.   |
| matched              | varchar(20)  | NULL DEFAULT NULL | Number of graduates that have been classed as matched.   |
| activityNotCaptured  | varchar(20)  | NULL DEFAULT NULL | Percentage of matched graduates whose activity could not be captured.  |
| noSustDest           | varchar(20)  | NULL DEFAULT NULL | Percentage of matched graduates with an unsustained destination.   |
| sustEmpOnly          | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates with a record or sustained employment only.  |
| sustEmp              | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates with a record or sustained employment (these graduates may or may not have a further study record in addition to a sustained employment record). |
| sustEmpFSorBoth      | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates with a record or sustained employment, a record of further study, or both.   |
| earningsInclude      | varchar(20)  | NULL DEFAULT NULL | Number of matched graduates included in earnings calculations.   |
| IowerAnnEarn         | varchar(20)  | NULL DEFAULT NULL | Annualised earnings lower quartile.  |
| medianAnnEarn        | varchar(20)  | NULL DEFAULT NULL | Median annualised earnings.  |
| upperAnnEarn         | varchar(20)  | NULL DEFAULT NULL | Annualised earnings upper quartile.  |
| POLARGrpOne          | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates in POLAR group 1 (of those eligible to be included in POLAR calculations).   |
| POLARGrpOneIncluded  | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates included in POLAR calculations.  |
| prAttBand            | varchar(20)  | NULL DEFAULT NULL | Prior attainment band.   |
| prAttincluded        | varchar(20)  | NULL DEFAULT NULL | Percentage of graduates included in prior attainment calculations.   |

Figure 3.1: NLongitudinal Education Outcomes Data Dictionary

#### 3.2.1.2 Basic Company dataset

The data set possesses up-to-date basic companies information on UK register. It contains information about company names, annual returns filing dates, location details, account and basic information about mortgage and business changes. The basic company data dictionary is created and shown as below:

| Basic Company Data Dictionary          |              |                   |  |  |  |  |
|--|--------------|-------------------|--|--|--|--|
|  | Data Type    | NULL              | Description                                  |  |  |  |
| CompanyName                            | VARCHAR(160) | NULL DEFAULT NULL |  |  |  |  |
| CompanyNumber                          | VARCHAR(8)   | NOT NULL (PK)     | Company number                               |  |  |  |
| CareOf                                 | VARCHAR(100) | NULL              | Registered Office Address Care Of            |  |  |  |
| POBox                                  | VARCHAR(10)  | NULL              | Registered Office Address PO BOX             |  |  |  |
| AddressLine1 (House number and street) | VARCHAR(300) | NULL              | Registered Office Address Line 1             |  |  |  |
| AddressLine2 (Area)                    | VARCHAR(300) | NULL              | Registered Office Address Line 2             |  |  |  |
| PostTown                               | VARCHAR(50)  | NULL              | Registered Office Address Post Town          |  |  |  |
| County                                 | VARCHAR(50)  | NULL              | Registered Office Address County             |  |  |  |
| Country                                | VARCHAR(50)  | NULL              | Registered Office Address Country            |  |  |  |
| PostCode                               | VARCHAR(20)  | NULL              | Registered Office Address Postcode           |  |  |  |
| CompanyCategory                        | VARCHAR(100) | NOT NULL          | Registered Office Address Company category   |  |  |  |
| CompanyStatus                          | VARCHAR(70)  | NOT NULL          | Registered Office Address Company Status     |  |  |  |
| CountryofOrigin                        | VARCHAR(50)  | NOT NULL          | Registered Office Address Country of Origin  |  |  |  |
| DissolutionDate                        | DATE         | NULL              | Registered Office Address Dissolution date   |  |  |  |
| IncorporationDate                      | DATE         | NULL              | Registered Office Address Incorporation date |  |  |  |
| AccountingRefDay                       | INT          | NULL DEFAULT 0    | Accounting references day                    |  |  |  |
| AccountingRefMonth                     | INT          | NULL DEFAULT 0    | Accounting Reference months                  |  |  |  |
| Account_NextDueDate                    | DATE         | NULL DEFAULT NULL | Account's next due date                      |  |  |  |
| Account_LastMadeUpDate                 | DATE         | NULL DEFAULT NULL | Account's last made up date                  |  |  |  |
| AccountCategory                        | VARCHAR(30)  | NULL              | Account category                             |  |  |  |
| Return_NextDueDate                     | DATE         | NULL DEFAULT NULL | Return next due date                         |  |  |  |
| Return_LastMadeUpDate                  | DATE         | NULL DEFAULT NULL | Return last made up date                     |  |  |  |
| NumMortCharges                         | INT          | NOT NULL          | Number of Mortgages charges                  |  |  |  |
| NumMortOutstanding                     | INT          | NOT NULL          | Number of Mortgages outstanding              |  |  |  |
| NumMortPartSatisfied                   | INT          | NOT NULL          | Number of Mortgages Partial satisfied        |  |  |  |
| NumMortSatisfied                       | INT          | NOT NULL          | Number of Mortgages satisfied                |  |  |  |
| SICCode1                               | VARCHAR(170) | NULL              | SIC Codes 1                                  |  |  |  |
| SICCode2                               | VARCHAR(170) | NULL              | SIC Codes 2                                  |  |  |  |
| SICCode3                               | VARCHAR(170) | NULL              | SIC Codes 3                                  |  |  |  |
| SICCode4                               | VARCHAR(170) | NULL              | SIC Codes 4                                  |  |  |  |
| NumGenPartners                         | INT          | NOT NULL          | Number of general partners                   |  |  |  |
| NumLimPartners                         | INT          | NOT NULL          | Number of limited partners                   |  |  |  |
| URI                                    | VARCHAR(47)  | NOT NULL          | URI  |  |  |  |
| pn_CONDate                             | DATE         | NULL DEFAULT NULL | Previous change of name date (occurs max 10) |  |  |  |
| pn_CompanyName                         | VARCHAR(160) | NULL DEFAULT NULL | Previous company name                        |  |  |  |

Figure 3.2: Basic Company Data Dictionary

#### 3.2.1.3 National Statistics Postcode Lookup (NSPL) dataset

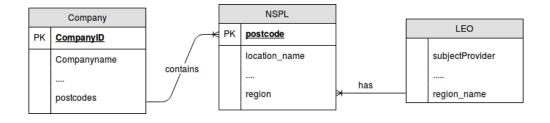

Figure 3.3: Entity Relationship Diagram

As postcode data for every location on earth is unique. Company data sets possess **postcode** field in the business address, but LEO dataset do not have the **postcode** field which leads to difficulty of defining a relationship between these two datasets. Figure above show NSPL dataset serves as a linker to map **region** column from LEO data to link with **postcode** column found in company datasets.

The data set possesses current postcode for the United Kingdom. It contains information relates postcode number, location, country name, parliamentary constitution, electoral and other geographical details. The NSPL data dictionary is created and shown as below:

## UK National Statistics Postcode Lookup (NSPL) Data Dictionary

| Data             | Data Type     | NULL          | Description                     |
|------------------|---------------|---------------|---------------------------------|
| Postcode1        | varchar(15)   | not null      | Postcode                        |
| Postcode2        |               |               |                                 |
|                  | varchar(15)   | not null (PK) | Postcode                        |
| Postcode3        | varchar(15)   | not null      | Postcode                        |
| date_introduce   | varchar(10)   | not null      | Date postcode first introduced  |
| usertype         | int           | not null      | Usertype value                  |
| easting          | int           | null          | Easting of location             |
| northing         | int           | null          | Northing of location            |
| position_quality | int           | not null      | Position quality of location    |
| countycode       | varchar(15)   | null          | County code                     |
| countyname       | varchar(50)   | null          | County name                     |
| county_lac       | varchar(15)   | null          | Local Authority Code of County  |
| county_lan       | varchar(75)   | null          | Local Authority Name of County  |
| wardcode         | varchar(15)   | null          | Ward code                       |
| wardname         | varchar(75)   | null          | Ward name                       |
| countrycode      | varchar(15)   | null          | Country code                    |
| countryname      | varchar(30)   | null          | Country name                    |
| region_code      | varchar(15)   | null          | Region code                     |
| region_name      | varchar(30)   | null          | Region name                     |
| par_cons_code    | varchar(15)   | null          | Parliamentary Constituency Code |
| par_cons_name    | varchar(50)   | null          | Parliamentary Constituency Name |
| eerc             | varchar(15)   | null          | European Electoral Region Code  |
| eern             | varchar(30)   | null          | European Electoral Region Name  |
| pctc             | varchar(15)   | null          | Primary Care Trust Code         |
| pctn             | varchar(70)   | null          | Primary Care Trust Name         |
| Isoac            | varchar(15)   | null          | Lower Super Output Area Code    |
| Isoan            | varchar(50)   | null          | Lower Super Output Area Name    |
| msoac            | varchar(15)   | null          | Middle Super Output Area Code   |
| msoan            | varchar(50)   | null          | Middle Super Output Area Name   |
| oacc             | varchar(5)    | null          | Output Area Classification Code |
| oacn             | varchar(50)   | null          | Output Area Classification Name |
| longitude        | decimal(10,8) | not null      | Longitude                       |
| latitude         | decimal(10,8) | not null      | Latitude                        |
| spatial_accuracy | varchar(30)   | null          | Spatial Accuracy                |
| last_upload      | date          | not null      | Postcode last uploaded date     |
| location         | varchar(50)   | null          | Location                        |
| socrataid        | int           | not null      | Socrata ID                      |

Figure 3.4: National Statistical Postcode Lookup Data Dictionary

#### 3.2.2 Ubuntu 16.04.03 LTS 64-bit OS

Ubuntu OS is an open source operating system with Linux distribution system and based on Debian architecture which provides long-term support (LTS) on security and fixes. [61] The reason Ubuntu operating system is selected for this project are described below:

- 1. Free and customizable. The openness of using Ubuntu OS offers a wide range of choices for the programmer to conduct development activities with Linux terminal. The APT packaging system allows developer to manage software and programming languages package efficient compared to Window operating system. The OS provides freedom in customisation for a developer to catered different sets of need with source access and root permission to meet project requirements.
- 2. Security. The system files are owned by root in Ubuntu OS and not accessible by casual user, malware and third party software without root privilege. [62] As the operating system is maintained and contributed by vast amount of developer and programmer due to its open source and environment, the bugs are fixed efficiently with regular updates and provide less vulnerability for the attacker to exploit the system. [63] The key factors underline within Ubuntu security provide sufficient statement to prove Ubuntu is more secure than Window or Mac OS on this project.
- 3. Consistent. Ubuntu OS provide excellent consistent from front-end (UIUX) to backend. The user interface and user experience of Ubuntu operating system increase usability and efficiency in development,

maintenance and deployment activities in the different version.

4. Stable and Reliable. UNIX preceded and outshine MS-DOS kernel with hardware abstraction, security model, resource management and various services that ran as background processes. [64] Ubuntu promotes multitasking and multi-user which is suitable and ideal for this project to conduct concurrent and distributed processing activities with PostgreSQL. Last but not least, MS-DOS is an image loader system that preload memory addresses without memory or resource management quickly leads to BSOD and data corruption during data processing.

# 3.2.3 Eclipse for Parallel Application Developers Oxygen Release (4.7.0) IDE.

Eclipse is an integrated development environment create and maintain by
Eclipse Open Source Project teams. The Eclipse Oxygen release possess better
functionality and performance for a developer to manage, build and deploy
software system. The reason Eclipse IDE is selected for development activities
in this project as listed as follows:

- 1. Auto Completion. The openness of using Ubuntu OS offers a wide range of choices for the programmer to conduct development activities with Linux terminal. The APT packaging system allows developer to manage software and programming languages package efficient compared to Window operating system. The OS provides freedom in customisation for a developer to catered different sets of need with source access and root permission to meet project requirements.
- 2. Integrated Environment. The system files are owned by root in Ubuntu OS and not accessible by casual user, malware and third party software without root privilege. [62] As the operating system is maintained and contributed by vast amount of developer and programmer due to its open source and environment, the bugs are fixed efficiently with regular updates and provide less vulnerability for the attacker to exploit the system. [63] The key factors underline within Ubuntu security provide sufficient statement to prove Ubuntu is more secure than Window or Mac OS on this project.

- 3. **Debugger.** Ubuntu OS provide excellent consistent from front-end (UIUX) to backend. The user interface and user experience of Ubuntu operating system increase usability and efficiency in development, maintenance and deployment activities in the different version.
- 4. Plugins. UNIX preceded and outshine MS-DOS kernel with hardware abstraction, security model, resource management and various services that ran as background processes. [64] Ubuntu promotes multitasking and multi-user which is suitable and ideal for this project to conduct concurrent and distributed processing activities with PostgreSQL. Last but not least, MS-DOS is an image loader system that preload memory addresses without memory or resource management quickly leads to BSOD and data corruption during data processing.

#### 3.2.4 PostgreSQL database 9.5.8

PostgreSQL is an open source object oriented relational database management system (OORDBMS) created by University of California [65] and currently maintained by the PostgreSQL Global Development Group with companies and contributors. [66] The reason PostgreSQL selected for data handling and data storage in this project are listed as follow:

1. Multi version concurrency control (MVCC). The database system allows client to perform concurrent request and transaction to data and enforcing data consistency. [67] It provided support for concurrency model and designed for high volume environments with serializable transaction isolation level to prevent dirty reads and better than row-level locking

provided by several enterprise database systems such as MySQL. [68]

- 2. Process-based. PostgreSQL server is process-based and not threaded-based which increase robustness and stabilisation during querying data compare to other database systems for this project. This can be explained by the difference between multiprocessing and multithreading. A single thread die kills whole multi threaded environment dies but single process terminate will not affect other process running.
- 3. PostgreSQL Studio. The database development tool allows users to perform development activities easily from a web-based console. It allows users to work with cloud databases without the need to open firewalls. [69]
- 4. Support Ubuntu OS. PostgreSQL provides lifetime support for Ubuntu version. The database system repositories such as core database server (postgresql-9.5), client libraries and binaries (postgresql-client-9.5) and other additional modules (postgresql-contrib-9.5) are supported and consistent with various Linux distribution. [70]
- 5. **Security.** PostgreSQL make data processing more safety compare to direct retrieval with CSV because it is not open for modification by normal user.

#### 3.2.5 Debugging and Tracing tools

Debugging could be painful for a software engineer to monitor and identify the performance of applications running in concurrent and distributed on sophisticated operating systems like Ubuntu. Tracing tools are required to ensure the efficiency, robustness, correctness and stability of the program.

Debugging with printf() for program bring many disadvantages and limitation during concurrency programming. The function could consume much memory in the multithreaded environment because it's not lightweight and thread safety. [71] Moreover, it is not an efficient way to identify problems occurs related to memory allocation or interruption.

Therefore, tracing is used in this project to understand event or consequence happens in a running software system without consuming the enormous amount of memory. [72] The techniques use tracepoint to record states and reading of variable and functions and save into trace file. Available software and terminal tools provide features to trace user applications and the operating system simultaneously to reduce debugging efforts during software quality assurance activities.

#### 3.2.5.1 LTTng Tracing Network

The Linux Trace Toolkit: next generation is an open source software toolkit simultaneously trace the Linux kernel, concurrent and distribute program in this project. [73] The performance and program states of mentioned program is difficult to be trace during the execution and runtime. The tools allow developer to create event rules and session to capture project's states of activity,

network streaming, snapshot and output into logger files with Logger. [74] In this project, the tracepoint is create and place into Go and Rust program to produce log files with CTF format await to be analyze.

#### 3.2.5.2 GDB Debugger

GDB is a build in GNU debugger for UNIX systems to debug programs to obtain information of root cause that cause the program to fail. [75] GDB allows set breakpoints and watchpoints on certain functions and print values during the program execution with terminal interface. Unfortunately, GDB possess limitation on finding bugs cause by memory leakage and compile errors.

#### 3.2.5.3 Eclipse Trace Compass

Eclipse Trace Compass is an open source application and plugin of Eclipse for analyzing and viewing logger files or trace created by GDB and LTTng tracepoint in this project. It helps reduce time to identify faults by observing states and processes in multi-core, distributed system execution and display useful information from call stack in program over the time. Trace compass reads and analyzing traces produce by LTTng tracing network and GNU debugger for live trace reading and monitoring during the debugging phases. The tool provide graphical representation on monitoring traces with events, statistic and histogram which can be used to track concurrent processes and threads performance in this project. [76]

#### 3.2.6 Concurrency programming

Concurrency is about deal with multiple tasks at the same time. In the real world, many things and event happen simultaneously in given time. Software design requires natural concurrency to deal with a huge load of request and demands to achieve efficiency and performance. Implementing concurrency required the creation of one or more additional threads to execute multiple processes or operation concurrently in a single core processor.

As computer hardware and multicore computer architectures are getting inexpensive, it provides the opportunity for application to utilized the processing power to perform tasks concurrently which substantially speed up computational work of the system.

Concurrent programming is introduced to use programming languages and algorithm to implement a concurrent system. A developer can choose to implement threads to perform multiple tasks with the system based on system design. However, thread management, synchronization, thread safety and run loops are major concerns and challenge for threads to run efficiently, correctly and prevent them interfering with other. Concurrent computation possesses logic limitation on observing arbitration processes and produce indeterminacy because threads or processes are communicating asynchronously.

In this project, we are going to compare two different types of the concurrent programming language with their respective underlying communication mechanisms and use performance to identify its expressive power.

#### 3.2.7 Benchmark on programming language comparison

To conduct a comparison between Go and RUST language, software benchmark method and criteria play an important role to obtain accurate performance and expressive power of language. The benchmarking of this project required assessing performance characteristic of computer hardware by running the program against compiler or database.

The component that are benchmarked in phase 1 are:

- 1. **SQL Queries run on program.** Go and Rust program execute the same amount of database retrieval query to achieve the fairness of comparison.
- 2. **Table configurations.** The space of table of this project should be same for Go and Rust program to test the performance.
- 3. Hardware configurations. Both Go and Rust program are required to run on same hardware configuration to achieve fairness of comparison on performance.

#### 3.2.7.1 System Context Diagram

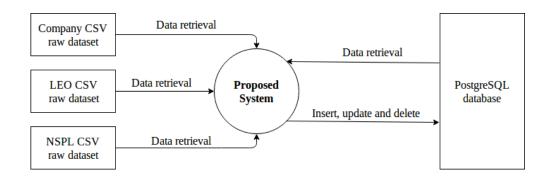

FIGURE 3.5: System Context Diagram

System context diagram provide high level view that defines relationship between proposed system with external entities. The proposed system is written in Go and Rust programming language with sequential and concurrent computing. The system shall process raw dataset stores in different nodes and dataset stores in PostgreSQL database. Moreover, the system should process data from raw CSV dataset and PostgreSQL database in sequential and concurrent manner.

#### 3.2.7.2 Block Diagram

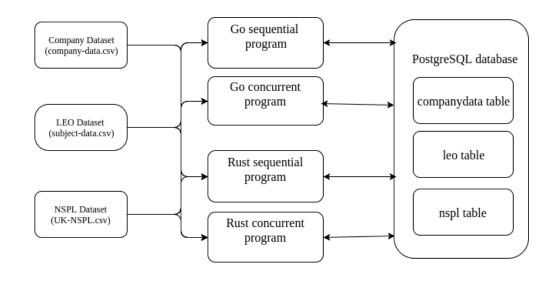

Figure 3.6: Block Diagram

The block diagram provides a high-level overview of importation CSV into PostgreSQL with Go and Rust program. The large dataset store is store in different nodes with CSV format. Data stores in PostgreSQL database and raw CSV data at different nodes will be processed by Go and Rust program with sequential and concurrent manner. The database table is created with query in the terminal before Go and Rust program is executed.

# 3.2.8 Go and RUST program for database retrieval with PostgreSQL

#### 3.2.8.1 Phase 1 Sequential program flowchart

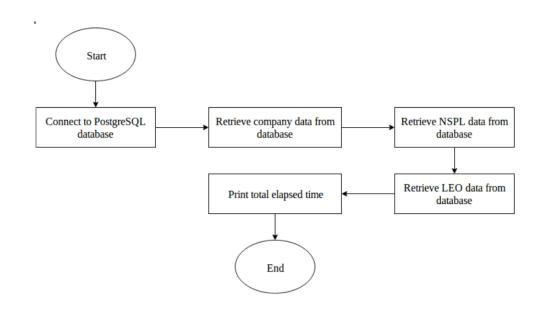

FIGURE 3.7: Phase 1 Sequential program flowchart

The flowchart provides a high-level view of concurrent manner during data retrieval in PostgreSQL with Go and Rust program. The program first establishes connection with PostgreSQL database with a connection string. Afterwards, it will retrieve a different set of data from various database table concurrently. The total elapsed time for entire program execution will be print.

#### 3.2.8.2 Phase 1 Concurrent program flowchart

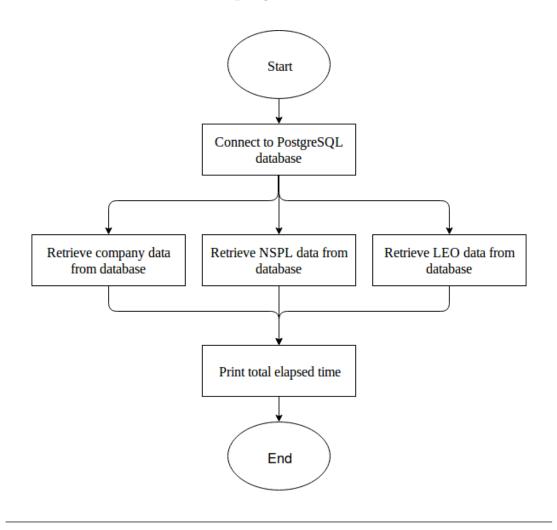

Figure 3.8: Phase 1 Concurrent program flowchart

The flowchart provides a high-level view on concurrent manner during data retrieval in PostgreSQL with Go and Rust program. The program first establish connection with PostgreSQL database with connection string. Afterwards, it will retrieve different set of data from different database table in concurrent manner. The total elapsed time for entire program execution will be print.

## 3.2.9 Go and RUST program for read CSV file.

#### 3.2.9.1 Phase 1 Sequential program flowchart

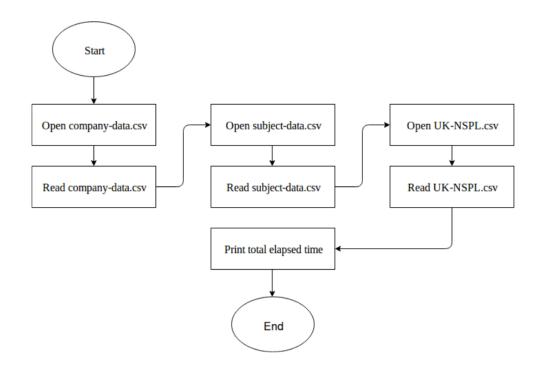

FIGURE 3.9: Phase 1 Sequential program flowchart

The flowchart provides a high-level view on sequential manner on reading CSV file with Go and Rust program. The program will open csv file and read containing data concurrently. The total elapsed time for entire program execution will be print.

#### 3.2.9.2 Phase 1 Concurrent program flowchart

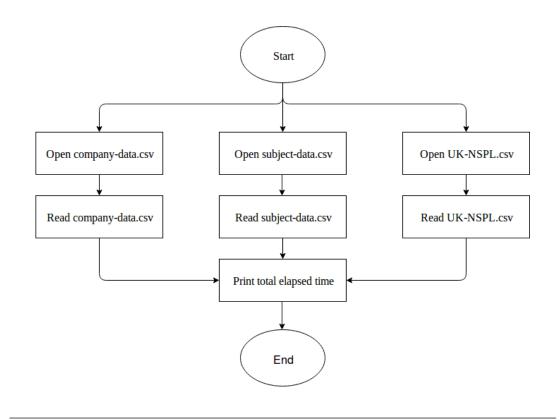

FIGURE 3.10: Phase 1 Concurrent program flowchart

The flowchart provides a high-level view on concurrent manner on reading CSV file with Go and Rust program. The program will open csv file and read containing data in particular order of sequence. The total elapsed time for entire program execution will be print.

#### 3.2.10 Proof of Concept in Phase 1

#### 3.2.10.1 Phase 1 Deployment Diagram

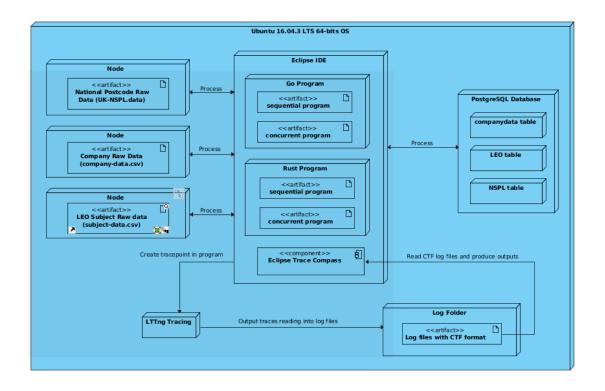

FIGURE 3.11: Phase 1 Deployment Diagram

The deployment diagram describes the proof of concept of phase 1 in specification level and overall architecture of the project. Three database table is created in PostgreSQL database prepare to be processed. Simultaneously, three large data sets are stored in different nodes await to be process or retrieved. The Go and Rust program are written in sequentially and concurrently to process data from CSV file or PostgreSQL database system.

LTTng tracing network is installed to create tracepoint in both Rust and Go program to obtain process reading and create traces as output into log files as Common Trace Format (CTF) format and store into log folder. Last but not least, Eclipse Trace Compass (an Eclipse IDE plugin) read CTF files and produce useful graphical and tabulated information from traces as output.

# Chapter 4

# Implementation Methodology

## 4.1 Software Engineering Methodology

Software engineering life cycle (SDLC) is a well structured and iterative sequence of stages in to deliver quality research which meet or exceed project scope. It involves five major activities in this project which are: :

- Communication. Student initiate the request to supervisor for apply specific project title offered in this semester. Requirement gathering is conducted in order to discuss the expectation of project and understand the critical factors to achieve project scope or objective. The process required mass amount of communication and collaboration between student and supervisor to ensure requirement are fully understood.
- Planning. Project management plan is define and prepare with Gantt Chart to manage project execution by considering risk assessment, resources estimation, time and task management. The tools and

techniques to be used requires to be understand in detail and comprehensive manner to achieve solid understand on whole project execution.

- Construction. The creation of project documentation and program through a combination of verification, coding, writing, debugging and testing. The complexity of project are required to be minimize and reduce with the use of standards. The program is construct based on requirement designed in software design phase to ensure the outcomes meet project objectives.
- **Testing.** The project outcomes and deliveries are required to update for supervisor and hand-in to the institution. Documentation and outcomes are required to conform with requirement specification and meet project requirements to ensure the project is doing right.

#### 4.1.1 Prototyping Model Method

The software prototyping method is build prototypes with limited functionality as preliminary design to represent an approximation of concept. The prototype is implemented as proof of concepts for project objectives and reviewed by supervisor to enhance the prototype.

Prototyping helps strengthen understanding the requirement of project through communication and negotiation. The characteristic and basic features of program are demonstrate to collect feedback for enhancement and improvement. This method helps improve familiarity and early determination of requirement specification before development process to reduce chances of fail in the project. Time and project resources can be estimated throughout the process to conduct task and time management in order to deliver the final product.

# 4.2 Agile Software Methodology

The process decision framework used by this project is Agile Methodology. The mentioned methodology simplified process decisions around incremental and iterative solution delivery, rapid deliver features and update in order to satisfy requirement for weekly project updates. Agile methodology provide flexibility for the project progress respond to change and modification from FYP weekly meeting.

Agile software development describes set of principles for product and technology development under which requirements and solutions evolve through the collaborative effort of self-organizing management. It advocates adaptive planning, evolutionary development, early delivery, and continuous improvement, and it encourages rapid and flexible response to change according to feedback provide by supervisor. The SDLC or paradigm involved in agile methodology in this project is Kanban.

#### **4.2.1** Kanban

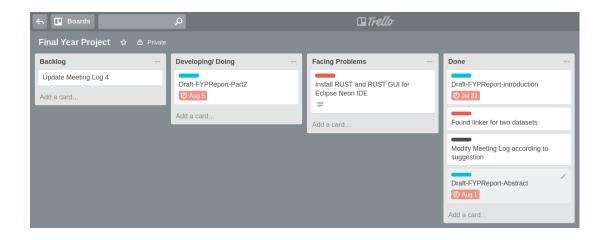

FIGURE 4.1: Kanban board

Kanban provide visual information of workflow by using sticky notes on a whiteboard to create a "picture" of our work. The board allow visualize the project development process or work flows within process and it helps ease the communicate status but also give and receive context for the work. Trello is used in this project as online Kanban board to manage the task in this methodology.

There are an amount of work-in-progress (WIP) on each simple phased process to prevents overproduction and reveals bottlenecks dynamically to aware several roles whether are in bottlenecks. As an example, if the software pipelines are Backlog, Developing, Facing Problems and Done. There are WIP limits on each phased to increase the inspection and create awareness in order to facilitate adaptation based on the work loads.

When a new requirement or changes requested, the task is insert into the backlog. The priority of the task are influenced by time constraint and importance. Afterwards, the task will be move into "developing" to began

construction of documentation or codes. Once the task is encountered difficulty and problem, it will move to "racing problem". Alternatively, the task will move to "done" once the task is completed and ready to submit or show to supervisor during meeting.

The Kanban events required to developed immediately and unknown incident may interrupt the progress depends on project feedback and requirement needs. A new high priority fix or changes may requested and it will break off the current project flow. Kanban allow the project respond to change efficiently and provide continuous update on progress to supervisor in order to submit quality works at end of project phase.

### 4.2.2 Methodology for this Project

In this project, we will be developing Go and Rust program for conduct concurrent and distributed programming. To achieve the required tasks, rapid communication and modification is conducted to improve quality of program and satisfy project objectives. Prototyping method and Kanban will be use in this project.

# 4.3 Project Infrastructure

#### 4.3.1 List of Hardware Resources

1. **64-bit Personal Computer.** This machine is used for research and development activities of this project. The details are tabulated and shown below:

| Processor    | 8x Intel ® Core (TM) i7-6700HQ CPU @ 2.60 Hz |  |  |
|--------------|--|--|--|
| GPU          | NVIDIA GEFORCE GTX960M GDDR4                 |  |  |
| Memory (RAM) | 16330MB, approximately 16GB                  |  |  |

FIGURE 4.2: Personal Computer Hardware table

#### 4.3.2 List of Software Resources

- 1. Linux Ubuntu 16.04.3 LTS 64-bit. The community driven and open source operating system is used to conduct concurrent and distributed computing with Go and Rust compiler installed. The details are discussed in Chapter 3.2.1.
- 2. Golang language compiler 1.8.3. The linux amd64 gccgo compiler build Go source code into binary executable with "go build" and run the go program with "go run". It is use to compile and run Go files this project.
- 3. Rust language compiler 1.20.0. The linux amd64 rustc compiler compile Go source code into executable with "rustc". It is use to compile Rust files in this project.

- 4. **PostgreSQL database 9.5.8.** The open source database management system is use for data handling and data storage for this project. The details are discussed in Chapter 3.2.3.
- 5. Eclipse for Parallel Application Developers Oxygen Release (4.7.0) IDE. The open source IDE provide perspective feature and integrated debugger to ease the coding and development activities for this project. The details are discussed in Chapter 3.2.2.
- 6. Goclipse Plugin for Eclipse IDE. The plugin provide debugging functionality, content assist, auto code indentation, open definition and integrated compiler for Go language on Eclipse IDE.
- 7. RUSTDT Plugin for Eclipse IDE. The plugin provide syntax highlighting, error reporting, outline support, auto code indentation, debugging functionality and integrated compiler for Rust language on Eclipse IDE.
- 8. LTTng Tracing network. The toolkits creating a tracepoint within Linux kernel, user application, libraries and output the traces into files. The details are discussed in Chapter 3.2.4.1.
- 9. **Eclipse Trace Compass.** The application view and analyze traces and produce useful graphical and tabulated information for debugging purposes. The details are discussed in Chapter 3.2.4.3.
- 10. **TeXstudio 2.10.8.** The software provide writing environment for create LaTeX document with numerous feature such as syntax-highlighting, reference checking with bibtex and various assistant. It is use for creating documentation for this project.

11. Visual Paradigm 14.1 free edition for non-commercial use. The software is a free Unified Modelling Language Computer-Aided Software Engineering tool support 13 UML diagram types for software design and modelling. It is use to draw diagrams for this project.

## 4.3.3 Other Project Resources

- 1. Synaptic Package Manager. The software system is a graphical package management program of APT libraries and provide same features as apt-get command. It provide great assist and help on managing software package dependencies. It is installed with "sudo apt-get install synaptic" in terminal.
- 2. Terminator. Terminator provide multiple tabs, safe quit, UTF-8 encoding, automatic logging to ease the development activities for developer. The system is required to update source list with "sudo apt-get update" and run "sudo apt-get install terminator" to install the repository.

#### 4.3.4 Infrastructure Setup and Installation

The required hardware and software resources are listed and discussed in Chapter 3.2, Chapter 4.2.1 and Chapter 4.2.2.

#### 4.3.4.1 Go language compiler installation

- 1. Ensure Golang go1.8.3.linux-amd64.tar.gz is downloaded using wget in terminal.
- 2. Ensure downloaded file is extract, move and rename Golang directory.
- 3. Ensure Golang's compiler export to system path.
- 4. Ensure Goroot and Gopath is set.
- 5. Ensure path to user profile bashrc file is append.
- 6. Ensure Go executable and Go version installation is success.
- 7. Ensure Go libraries such as gocode, golint, guru, goimports, gorename and godef into Gopath directory are installed.
- 8. Ensure Godef Gometalinter is downloaded and executed.

The full installation steps for Go language compiler is found in Appendix A.1.

#### 4.3.4.2 RUST language compiler installation

- 1. Install Rust toolchain with command line.
- 2. Export rust executable to system path.
- 3. Install Racer, Rustfmt, Rainicorn.
- 4. Ensure all the required Rust executables are installed.

The full installation steps for RUST language compiler is found in Appendix A.2.

#### 4.3.4.3 Eclipse IDE installation

- 1. Ensure Java is installed before start download Eclipse.
- 2. Run "sudo apt-get update" and "sudo apt-get upgrade" before start download.
- 3. Make eclipse-workspace folder as default storage for better management.

The installation details for Eclipse IDE is found in Appendix A.3.

#### 4.3.4.4 GoClipse plugin for Eclipse IDE installation

- 1. Install Goclipse plugin with Eclipse marketplace.
- 2. Ensure Goclipse preferences and setting are correct.

The full installation steps for Goclipse plugin on Eclipse IDE is found in Appendix A.4.

#### 4.3.4.5 RustDT plugin for Eclipse IDE installation

- 1. Install RustDT plugin with Eclipse marketplace.
- 2. Ensure RustDT preferences and setting are correct.

The full installation steps for RustDT plugin on Eclipse IDE is found in Appendix A.5.

#### 4.3.4.6 PostgreSQL database installation and setup

- 1. Install postgreSQL in command line.
- 2. Ensure database for FYP1 is created.
- 3. Create new user for database.
- 4. Ensure database connection is established with user access.

The full installation steps for RustDT plugin on Eclipse IDE is found in Appendix A.6.

#### 4.3.4.7 LTTng Tracing network installation

- 1. Install LTTng repository
- 2. Update list of packages.
- 3. Install the main LTTng packages.

The full installation steps for RustDT plugin on Eclipse IDE is found in Appendix A.7.

#### 4.3.4.8 Eclipse Trace Compass installation

- 1. Search for available software in Eclipse.
- 2. Ensure Trace Compass is selected in Eclipse Software Installation window.
- 3. Review the items to be installed.
- 4. Install kernel analysis, userspace analysis and tracepoint analysis for LTTng and GDB.

The full installation steps for RustDT plugin on Eclipse IDE is found in Appendix A.8.

#### Chapter 5

#### Implementation Plan

#### 5.1 Project Task Identification

#### 5.1.1 Identification of Critical Success Factors

Critical success factors are a key requirement which is necessary and essential to be identified to achieve the project objectives in this project. The requirement for our design objectives are listed below:

- 1. **Determine a suitable operating system.** The operating system should be reliable, secure and appropriate for data processing, concurrent and distributed computing activities. If the selected operating system does not meet requirements, a new operating system has to be considered.
- 2. Acquire free public data set for big data processing. Large data set is required for data processing with concurrent and distributed computing to make use of concurrent programming language's package

- and architecture. If the data set obtains not clean and useful, data cleansing and data deduplication have to be conducted.
- 3. Selection of database management system (DBMS). The database-management system for this project should support for operating system, concurrent programming language and project activities. If the selected DBMS does not compatible and suitable, a new DBMS capability has to be considered.
- 4. Installation and setup DBMS for big data handling. The selected database-management system should be installed and running on the operating system for data storing and data handling. The database system allows developer to conduct development activities for manage concurrency control for update and retrieval in this project.
- 5. Selection of Go and RUST concurrent programming language for comparison. There are many types of concurrent programming language for system development. The selected language for this project is RUST and Go. This programming language architecture, packages and capabilities should be considered to conduct performance comparison.
- 6. Coding of "Import CSV into database" with Go program. The program is required to write with Go language to read CSV and upload into PostgreSQL database. This task is conduct for data definition and data preparation before data processing is performed.
- 7. Coding of "Import CSV into database" with RUST program.

  The program is required to write with Go language in order to read CSV and upload into PostgreSQL database. This task is conduct for data definition and data preparation before data processing is performed.

- 8. Conduct minor comparison on sequential and concurrent programming with Go and RUST language on PostgreSQL database transaction. The sequential and concurrent program is required to write with Go and RUST language in order to conduct a comparison of execution time for database retrieval on PostgreSQL.
- 9. Conduct minor comparison on sequential and concurrent programming with Go and RUST language on reading CSV files. The sequential and concurrent program is required to write with Go and RUST language to conduct a comparison of execution time on reading CSV files.
- 10. Installation of LTTng tracing network on user application or

  Linux kernel to produce outcomes into log files. The open source
  software tracing toolkits enable the developer to create a tracepoint in
  Linux kernel or user applications to obtain process reading and create
  output into log files as Common Trace Format (CTF). This task has to be
  completed to improve troubleshooting and debugging process.
- 11. Install Eclipse Trace Compass to extract and read Common

  Trace Format information from log files. The open source Eclipse

  IDE plugin read CTF files and produce useful graphical and tabulated
  information from traces. This task has to be completed to improve
  debugging process and analyse process behaviour.

#### 5.1.2 Project Tasks for FYP Phase 1

- 1. Installation of Ubuntu 16.04 LTS 64-bit operating system.
- 2. Acquire free public data set for big data processing.
- 3. Installation of Eclipse Parallel Application IDE Parallel Oxygen version.
- 4. Selection of Go and RUST concurrent programming language for comparison.
- 5. Installation of Go language compiler and Goclipse plugin for Eclipse IDE.
- Installation of RUST language compiler and RustDT plugin for Eclipse IDE.
- 7. Selection of PostgreSQL object-oriented relational database management system (OORDBMS).
- 8. Installation and setup PostgreSQL database system intro PC for data handling.
- 9. Golang programming for import CSV files into PostgreSQL database.
- 10. Sequential and concurrent programming with Golang on PostgreSQL database retrieval.
- 11. Sequential and concurrent programming with Golang on reading CSV files.
- 12. Big data checking, cleaning and preparation with Devil Advocate.
- 13. Installation of LTTng tracing network on user application or linux kernel.
- 14. Install Eclipse Trace Compass to extract and read Common Trace Format information from log files.

5.1.3 Gantt Chart for Phase 1

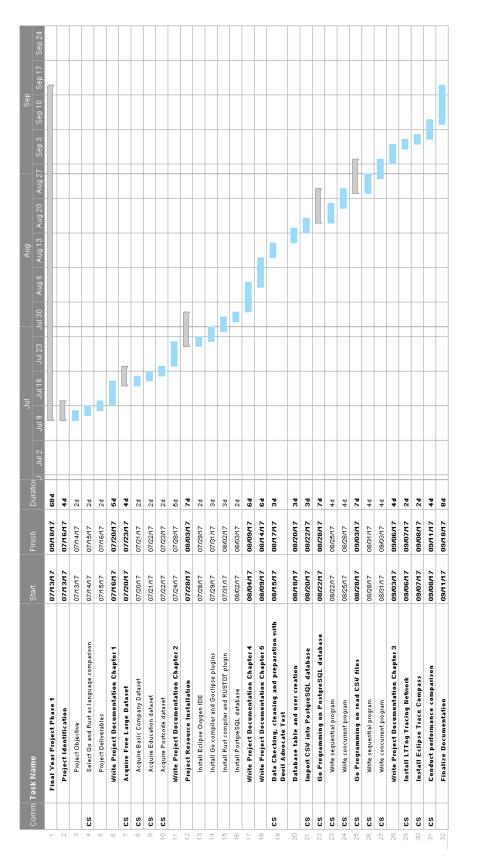

FIGURE 5.1: Gantt Chart for Phase 1

#### 5.1.4 Project Tasks for FYP Phase 2

- 1. Data auditing.
- 2. Data cleansing.
- 3. Data duplicate elimination.
- 4. Data parsing.
- 5. Programming for import CSV files into PostgreSQL database.
- 6. Sequential and concurrent programming with Go and RUST on PostgreSQL database retrieval.
- 7. Sequential and concurrent programming with Go and RUST on reading CSV files.
- 8. Distribute programming for real time processing system.
- 9. Create tracepoint in application program and linux kernel.
- 10. Acquire process reading.
- 11. Testing concurrent and distributed system.

5.1.5 Gantt Chart for Phase 2

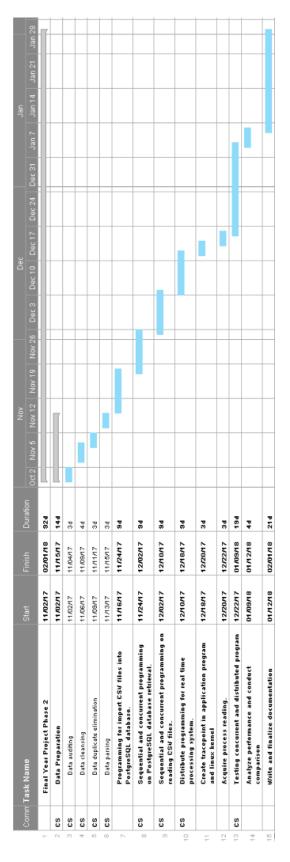

FIGURE 5.2: Gantt Chart for Phase 2

#### 5.1.6 Milestone Deliverables

The milestone deliverables are:

- 1. A Golang program.
- 2. A RUST program.
- 3. A report based of this project.

#### 5.2 Planned Execution Activities

#### 5.2.1 Phase 1

- 1. **Devil Advocation Test.** The 'Devil Advocation' tests are conducted to ensure obtained raw CSV data set is clean and useful. The expected result of this test is the number of commas in the record should not exceed the number of columns in a database. In addition, the data content itself should be unique and suitable for storing in the database. More information is provided in Appendix B.1.
- 2. Golang programming for import CSV files into PostgreSQL database. The Golang programming for import CSV raw data into PostgreSQL is to ensure Go language is capable of processing raw CSV data and PostgreSQL database. The expected result for this program should read 100 rows of data from raw CSV file and insert into PostgreSQL database. More information is provided in Appendix C.

- 3. Sequential and concurrent programming with Golang on PostgreSQL database retrieval. The Go program should retrieve 300 rows of data from three tables (each table 100 rows) in PostgreSQL database sequentially and concurrently. The expected result for this program is concurrent processing should have better performance than sequential. More information is provided in Appendix D.
- 4. Sequential and concurrent programming with Golang on reading CSV files. The Go program should retrieve 100 rows of data from raw CSV file sequentially and concurrently. The expected result for this program is concurrent processing should have better performance than sequential. More information is provided in Appendix E.

#### Chapter 6

#### Results and Findings

#### 6.1 Phase 1

- 1. **Devil Advocation Test.** This activity has been successfully achieved. It has been found the method can detect unmatched numbers of commas, unsuitable data types during data importation from CSV to PostgreSQL database and identify the uniqueness of rows and columns in data. Results and detailed information is provided in Appendix B.2 to B.4.
- 2. Golang programming for import CSV files into PostgreSQL database. This activity has been successfully achieved. The program is capable to read 100 rows of data from three datasets and import into PostgreSQL database. Results and detailed information is provided in Appendix H.

- 3. Sequential and concurrent programming with Golang on PostgreSQL database retrieval. This activity has been successfully achieved. The program is capable to prove concurrent processing is faster than sequential in data retrieval with PostgreSQL database. Results and detailed information is provided in Appendix G.
- 4. Sequential and concurrent programming with Golang on reading CSV files. This activity has been successfully achieved. The program is capable to prove concurrent processing is faster than sequential in reading CSV data. Results and detailed information is provided in Appendix F.

#### Chapter 7

# Comparison Discussion and Recommendations

# 7.1 Problems Encountered & Overcoming Them

# 7.1.1 Acquisition of free large datasets for data processing.

The problem encountered during data gathering of this project is difficulty on finding suitable free big data from websites. It is a challenge to find problem and raise question by going into data details. It took huge amount of time to understand the focus of project and gather desired data for problem solving.

With the help of supervisor, I had successfully obtained suitable datasets for this project. He provides guidance and helping hand to clear my doubts and confusion by suggests several website and introduce various data repositories during the meeting.

#### 7.1.2 Goclipse plugin compile error

Eclipse IDE could not compile and build my Go files, this is because the IDE couldn't find GOROOT in usr/local/go. The development activities cannot proceed and face impediment on executing critical success factors. The cause of the problem is Golang compiler executable doesn't possess a copy in usr/local/go, which caused Eclipse fail to compile Go file because couldn't file the compiler.

The problem is resolved with help of supervisors, he guides me to execute Linux command line to resolve the problem during FYP meeting. Moreover, he helps identify the root cause of problem with Google Hangout in the midnights.

#### 7.1.3 Unclear and doubts on writing documentation

The problem encountered during writing documentation is unclear about the purpose and objectives of each section which leads to messy and poor content deliveries in writing. A certain standard and requirement should be achieved in writing the FYP document.

The problem is resolved with the help of supervisor as he patiently guide us to arrange the content layout of document and writing citation with references.

#### 7.1.4 Difficulty on understand concurrent programming

The problem encountered during coding process is to understand concurrent concepts. It took an enormous amount of time to implement the ideas of Goroutine and Go channel into the program to achieve concurrency with Go programming language. This is because I do not possess the experiences and knowledge to build a concurrent program.

The problem is resolved with the help of official documentation and StackOverflow websites which provide clear explanation and enlightenment for me to understand the concepts and semantics of languages.

#### 7.2 Execution time performance comparisons

## 7.2.1 Performance comparisons of Golang process PostgreSQL database

Table G.2 in Appendix G shows the total elapsed time for Go sequential program and Go concurrent program to retrieve 300 rows of data from PostgreSQL. Real refers to actual elapsed time for the program; user and sys refer to CPU time used by process. Fmt.Println() of data retrieval is removed during the execution to obtain accurate results on program performance. It is found that concurrent programming is faster than sequential programming on process data from PostgreSQL database.

However, the amount of CPU time spent in the kernel within the process (sys) by concurrent program is higher than sequential program. This is probably

caused by utilization of hardware resources when goroutine and gochannel are communicating in the process.

## 7.2.2 Performance comparisons of Golang process raw CSV files

Table F.1 in Appendix F shows the total elapsed time for Go sequential program and Go concurrent program to retrieve 300 rows from raw CSV data. Real refers to actual elapsed time for the program; user and sys refer to CPU time used by process. Fmt.Println() of data retrieval is removed during the execution to obtain accurate results on program performance. It is found that concurrent programming is faster than sequential programming on process data from raw CSV files.

The optimization to implementations in textitencoding/csv has improved [77] and fixed slow reading problems in Go version 1.8. The build-in CSV library works blazingly well with bufio.Reader() to split the commas during the read CSV files process.

#### Chapter 8

#### Conclusions

#### 8.1 Conclusions

In phase 1, we have review many concepts and addressed the details of concurrent programming language concepts.

The project objectives for Phase 1 are:

- 1. To learn and understand about Go and RUST programming language concepts and their concurrent processing features.
- 2. To conduct a comparison on Go programming language concepts in processing big data with different techniques.
- 3. To implement the handling of big data with PostgreSQL, an object-oriented relational database management system (OORDBMS)

What we have achieved on Phase 1:

- 1. We reviewed different concepts and characteristics of concurrent programming language.
- 2. We established the fundamentals of concurrent programming knowledge and possess confident advance to the next phase of development.
- 3. We established a development platform for concurrency programming.
- 4. We demonstrated the capability of concurrent programming language, which is provide better performance and throughput on data processing compare to sequential programming with results.

#### 8.2 Lessons Learned

- 1. **Data science knowledge.** Data science is being use as competitive weapon and it transform the way how companies operate with information. It is a totally new knowledge and experience for me as Software Engineering student to learn and explore.
- 2. Concurrent programming concepts. Concurrent concepts is difficult to be understand and never thought in subject syllabus. Learning the art of concurrent programming for building applications in this project provide satisfaction and motivation to fulfill my desire to build a real-time system.
- 3. Consistent update with FYP Supervisor. FYP supervisor ensure the project is on track and doing right. It is essential to make available time for consultation and rapidly update the progress for supervisor via email to enhance the work quality. Moreover, FYP supervisor review my work ensure the time and resource is not waste on doing the wrong task.

4. **Ubuntu Operating System.** The project allow me to learn Linux Bash commands through practice. I had found Ubuntu operating system is not hard to use and its more safety, reliable and consistent to conduct development activities due to its lightweight.

#### 8.3 Recommendations for Future Work

- 1. GORM for CRUD on data processing. GORM is an Object-relational mapping (ORM) library for Golang that converting data from incompatible files types into struct or interface. For instance, this project does not use GORM to import data and possess poor readability, error handling and maintainability in program. It is recommend to import data with GORM package because it supports auto migration, associations with database and every features are tested.
- 2. Benchmark on language performance comparsion. Although this project possess well-defined of benchmarking on database table spacing, hardware configuration and amount of query execution on data retrieval to conduct language performance comparison. These benchmarks are insufficient to determine the accurateness of programming language performance. This is because the CPU usage might be running on other processes or program while conducting the performance test. It is recommend to unified number of processes running in background and programming style for performance comparison between different concurrent programming languages.

3. Data quality. Although this project use Devil Advocation Test method to identify data quality. The method is insufficient to ensure data obtained is valid, complete and accurate to be processed. It is recommend to use several scripting language such as Python and Perl to identify internal data consistency and data cleansing is required to eliminate duplication of data.

LISTING A.1: linux command for Golang compiler installation

### A.2 Linux command for Rust compiler installation

```
(1) INSTALL COMMANDLINE Rust toolchain
       yinghua@yinghua-NL8C:~/Desktop/apps/rust$ curl https://sh.rustup.rs -sSf | sh
       This will download and install the official compiler for the Rust programming
      language, and its package manager, Cargo.
      It will add the cargo, rustc, rustup and other commands to Cargo's bin directory, located at:
15
16
      /home/yinghua/.cargo/bin
      This path will then be added to your PATH environment variable by modifying the profile file located at:
17
18
      /home/yinghua/.profile
       You can uninstall at any time with rustup self uninstall and these changes will
23
24
25
26
      Current installation options:
      default host triple: i686-unknown-linux-gnu default toolchain: stable
      modify PATH variable: yes
31
32
33
       1) Proceed with installation (default)
       2) Customize installation
      3) Cancel installation
34
35
      info: syncing channel updates for 'stable-i686-unknown-linux-gnu' 156.7 KiB / 156.7 KiB (100 %) 126.1 KiB/s ETA: 0 s info: downloading component 'rustc' 38.9 MiB / 38.9 MiB (100 %) 505.6 KiB/s ETA: 0 s
       stable installed - rustc 1.17.0 (56124baa9 2017-04-24)
\frac{44}{45}
      Rust is installed now. Great!
      To get started you need Cargo's bin directory in your PATH environment variable. Next time you log in this will be done automatically.
      To configure your current shell run source $HOME/.cargo/env
      yinghua@yinghua-NL8C:~/Desktop/apps/rust$
       (2) EXPORT RUST EXECUTABLE TO PATH
      yinghua@yinghua-NL8C: *$ cd ^/Desktop/apps/rust/

LISTING A.2: Linux RTAI Kernel Version and Ubuntu Version

#### A.3 Eclipse IDE installation

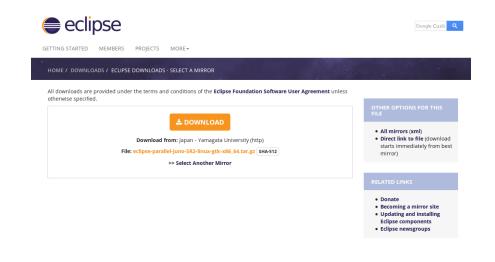

FIGURE A.1: Eclipse Oxygen Download Official Website

Ensure the Eclipse IDE version selected is compatible with 64-bit Ubuntu Operating System.

### A.4 GoClipse plugin for Eclipse IDE installation

#### A.4.1 Eclipse Marketplace

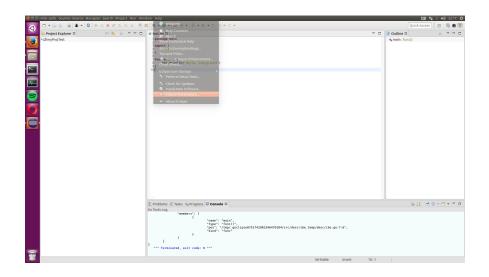

FIGURE A.2: Eclipse IDE Marketplace

Open Eclipse Marketplace from Help and select Eclipse Marketplace to search for GoClipse plugin.

#### A.4.2 Search Marketplace

FIGURE A.3: Search Eclipse IDE Marketplace

Type "Go" in search bar and press Go button to search for available plugin. Press install now to proceed with installation.

#### A.4.3 Open Perspective

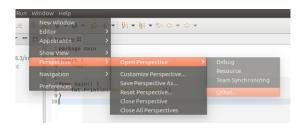

FIGURE A.4: Open Perspective

After the installation is done and success, open Eclipse Perspective by select Window, Perspective, Open Perspective and choose Other.

#### A.4.4 Choose Perspective

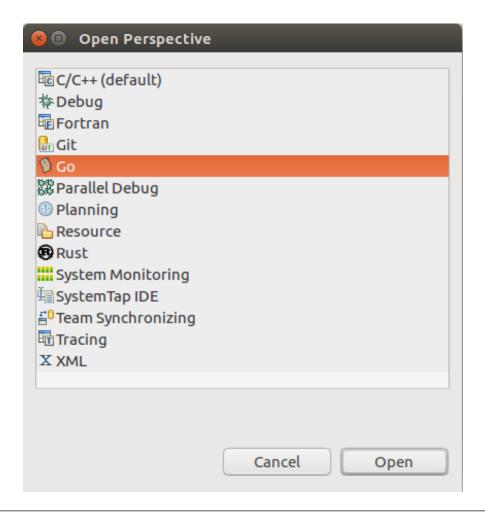

FIGURE A.5: Choose Go Perspective

Choose Go Perspective and press Enter.

#### A.4.5 Set Go compiler and GOPATH

goclipse-setting.png goclipse-setting.png Preferences type filter text × General GoClipse v0.16.1 ▶ C/C++ Go installation: ChangeLog Directory: /home/yinghua/Desktop/apps/golang1.8.3 B<u>r</u>owse... Fortran Build Console Use same value as the GOPATH environment variable. ▶ Editor /home/yinghua/Desktop/apps/gopath Tools Add Folder ▶ Help ☑ Also add project location to GOPATH, if it's not contained there already. Install/Update Library Hover Man pages ▶ Mylyn Oomph ▶ Parallel Tools Remote Development ▶ RPM ▶ Run/Debug ▶ Rust Restore <u>D</u>efaults ▶ SystemTap ? Apply and Close

FIGURE A.6: Set Go compiler and GOPATH

Set Go compiler and GOPATH into Goclipse plugins.

#### A.4.6 Set GOCODE, GURU, GODEF and GOFMT path

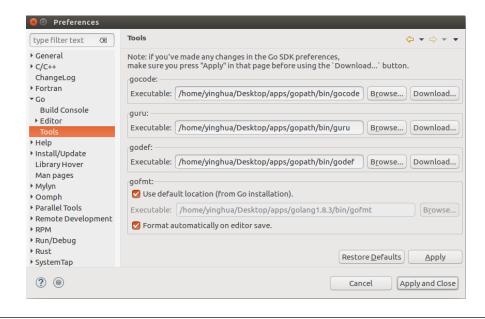

FIGURE A.7: Set GOCODE, GURU, GODEF and GOFMT path

Set GOCODE, GURU, GODEF and GOFMT executable path into Goclipse plugins and press "Apply and Close" to complete the setup process.

#### A.4.7 Test Go compilation in Eclipse IDE

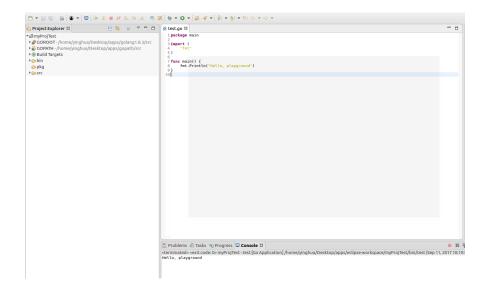

FIGURE A.8: Test Go compilation in Eclipse IDE

Test Go compilation with simple Hello Playground program, the setup process is successful if the Go program is compile and run correctly.

#### A.5 RustDT plugin for Eclipse IDE installation

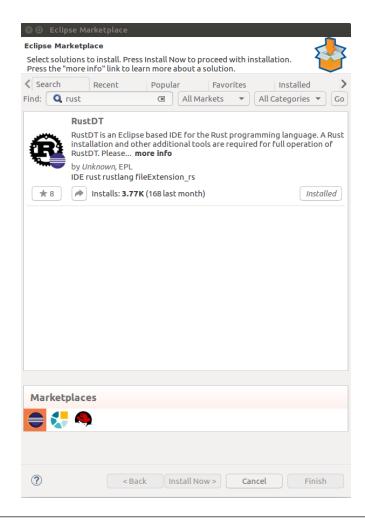

FIGURE A.9: Test Go compilation in Eclipse IDE

Open Eclipse Marketplace similar to step in Appendix A.4.1 to A.4.7. Search the marketplace by type "Rust" in search bar and press Go button to search for tools. Press install now to proceed with installation. The setup process is similar with Goclipse installation process, once the installation and setup is done. The program will compile and run successfully.

# A.6 Linux command for PostgreSQL database installation

```
Step 1 - Install postgreSQL in command line
     yinghua@yinghua-NL8C:~$ sudo apt-get update yinghua@yinghua-NL8C:~$ sudo apt-get install postgresql postgresql-contrib
     [sudo] password for yinghua:
     Step 2 - Create database for FYP1
     postgres=# create database fyp1;
CREATE DATABASE
15
     postgres=# \1
List of databases
Name | Owner | Encoding | Collate | Ctype | Access privileges
18
19

        fyp1
        | postgres | UTF8
        | en_US.UTF-8 | en_US.UTF-8 |

        postgres | postgres | UTF8
        | en_US.UTF-8 | en_US.UTF-8 |

        template0 | postgres | UTF8
        | en_US.UTF-8 | en_US.UTF-8 |

                                        | en_US.UTF-8 | en_US.UTF-8 |
| en_US.UTF-8 | en_US.UTF-8 | =c/postgres
     | postgres=CTc/postgres
     Step 3 - Initial login with postgres user into psql \,
      yinghua@yinghua-NL8C:~$ sudo -i -u postgres psql
     psql (9.5.7)
Type "help" for help.
     Step 4 - Add myself as new user for PostgreSQL with Superuser access
      yinghua@yinghua-NL8C:~/Documents/FYP/Postcode-data/uk-postcodes-master$ sudo -i -u postgres psql fyp1
     [sudo] password for yinghua:
psql (9.5.7)
Type "help" for help.
     postgres@yinghua-NL8C:~$ createuser -P -s -e yinghua
     Enter password for new role:
Enter it again:
CREATE ROLE yinghua PASSWORD 'md5eec308d944ffa817c37ee6230b0c98eb' SUPERUSER CREATEDB CREATEROLE INHERIT
47
     Step 5 - List all the user in PostgreSQL
      postgres=# \du
     postgres | Superuser, Create role, Create DB, Replication, Bypass RLS | {} yinghua | Superuser, Create role, Create DB
     Role name | Attributes
                                                                                            | Member of
58
59
     Step 6 - Connect FYP1 Database
      postgres=# \c fyp1
      You are now connected to database "fyp1" as user "postgres".
     Step 7 - Check whether there are tables in FYP1 database
```

LISTING A.3: Linux RTAI Kernel Version and Ubuntu Version

Install PostgreSQL database with command line using APT package. After the installation is success, create new user for new database in PostgreSQL.

#### A.7 Linux command for LTTng Tracing Network installation

```
yinghua@yinghua:~$ date
       Sun 17 Sep 03:17:30 MYT 2017
       yinghua@yinghua:~$ uname -a
Linux yinghua 4.10.0-33-generic #37~16.04.1-Ubuntu SMP Fri Aug 11 14:07:24 UTC 2017 x86_64 x86_64 x86_64 GNU
/Linux
 5
6
       (Step 1) Add the LTTng Stable 2.10 PPA repository
       \label{limits} yinghua@yinghua:``$ sudo apt-add-repository ppa:lttng/stable-2.10 sudo: unable to resolve host yinghua

LISTING A.4: Linux RTAI Kernel Version and Ubuntu Version

Add LTTng Stable 2.10 PPA repository with sudo access and update the list of packages. Afterwards, install the main LTTng 2.10 packages.

#### A.8 Eclipse Trace Compass Installation

#### A.8.1 Search for tools in Eclipse

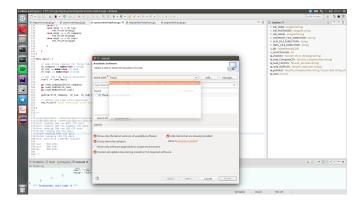

Figure A.10: Search for tools in Eclipse Plugins Installation Window

Search for Trace Compass in Eclipse IDE by click Help and choose "Install New Software"

#### A.8.2 Select Trace Compass in search results

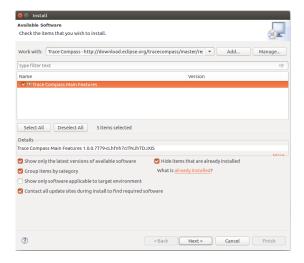

FIGURE A.11: Select Trace Compass in search results

Select "Trace Compass Main Features" and proceed with by click Next.

## A.8.3 Review install details and proceed with installation

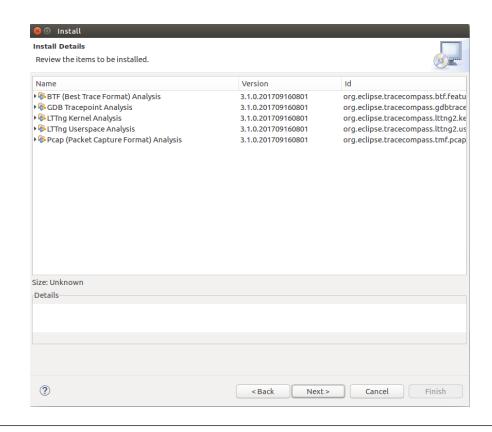

FIGURE A.12: Review install details and proceed with installation

Review all the items to be installed and click Next, the installation will be started and complete if without errors.

## Appendix B

### **Devil Advocation Test**

#### **B.1** Introduction

The devil advocation test is conducted to ensure obtained raw CSV data are clean and useful. The test is conduced to ensure:-

- 1. The number of commas in each records should match number of columns in database.
- 2. Raw data from CSV should match the column's data type in database for data importation and preparation.
- 3. Review and check uniqueness of data in each columns and row.

# B.2 Match number of commas with database columns

LISTING B.1: Match number of commas with database columns

In this section, PostgreSQL query is executed on a terminal to check the number of commas match the number of columns possesses in the table. We will purposely remove one column during table creation and try to import all rows of data into PostgreSQL database.

The terminal will return an error and complains data could not insert into the table because a column is expected during importation process.

LISTING B.2: Identify correctness of data types

Ultimately, the CSV raw data will import successfully only if the count of commas match the counts of columns in table.

# B.3 Identify correctness and suitability of data types

Listing B.3: Identify correctness of data types

In this section, PostgreSQL query is executed on a terminal to check the suitability and correctness of data types during data importation from CSV files to PostgreSQL database.

The terminal will return an error and because double quotes are not allow to insert into "date" datatypes. It is caused by the NULL values in company CSV raw data is generated with double quotes and unable to insert them into "date" data types.

```
Step 5 - Remove null value with double quotes for data insertion on DATE DATATYPE

yinghua@yinghua-NL8C:~/Documents/FYP/Basic-Company-Data$ sed 's/""//g' Basic-Company-Data-Full.csv > Full.csv

Step 6 - Import data into companydata table

step 6 - Import data into companydata table

csv

fyp1=# \copy companydata from 'Full.csv' with header csv;

COPY 4077979
```

LISTING B.4: Remove null values with double quotes in CSV raw data

As the meaning of null values with double quotes and without quotes are the same. To resolve this problem, *seq* command is required produce new files by remove null values with double quotes stores in each columns. The CSV raw data will import successfully if every columns of data match table's column data types.

## B.4 Identify row and column uniqueness in each raw data

Data redundancy and duplication is an inevitable phenomenon found in million of data obtained from on-line sources. Unintentional duplication of records created from data warehouse are hardly avoided. Therefore, the uniqueness of data has to be check in every row and columns for conduct data de-duplication in Phase 2.

#### B.4.1 Identify row uniqueness

```
Step 1. connect to database
      yinghua@yinghua:~$ psql fyp1;
     psql (9.5.8)
Type "help" for help.
     fyp1#Data redundancy and duplication is an inevitable phenomenon found in million of data obtained from on-
line sources. Unintentional duplication of records created from the data warehouse 's hard to be
avoided. Therefore, the uniqueness of data has to be check in every row and columns for conduct data
de-duplication in Phase 2.
     Step 2 - Verify duplicates row in company data tables
13
14
     fyp1=# select (companydata.*)::text, count(*) from companydata group by companydata.* having count(*) > 1;
      companydata | count
      (0 rows)
     Step 3 - Verify duplicates row in subject data tables
     fyp1=\# select (leo.*)::text, count(*) from leo group by leo.* having count(*) > 1;
        leo | count
     (0 rows)
     Step 4 - Verify duplicates row in LEO data tables
     fyp1=# select (leo.*)::text, count(*) from leo group by leo.* having count(*) > 1;
           o | count
     (0 rows)
      Step 5: Verify duplicates row in NSPL data table
     fyp1=# select (nspl.*)::text, count(*) from nspl group by nspl.* having count(*) > 1;
40
       nspl | count
     (0 rows)
```

LISTING B.5: Identify row uniqueness

In this section, PostgreSQL query is executed on a terminal to identify duplicates row found in every table. The result shows that there is no row duplication occurs between rows.

#### B.4.2 Identify column uniqueness

```
yinghua@yinghua:~$ psql fyp1;
      psql (9.5.8)
Type "help" for help.
      Step 2. List structure of table
12
13
      fyp1=# \d+ leo
      Table "public.leo"
                                                                                                                | Storage |
      Column
                                                                                    Modifiers
                                 | integer
                                                                   | not null
                        | character varying(100)
      providername
                                                                                                                    extended
                                                                   | not null
      region | character varying (100)
subject | character varying (50)
                                                                                                                   extended
                                                                     not null
                                                                                                                   extended
      sex | character varying(30)
yearaftergraduation | character varying(30)
                                                                     not null
                                                                                                                   extended
                                                                                                                   extended
24
25
26
27
28
29
                                 | character varying(10)
                                                                     {\tt default\ NULL::character\ varying\ |\ extended}
      grads | character varying(10)
unmatched | character varying(20)
                                                                  | default NULL::character varying | extended
      (more columns are not shown....)
\frac{30}{31}
      Step 3. Check duplication of data in selected columns
32
      fyp1=# select ukprn, providername, region, count(*) from leo group by ukprn, providername, region having
             count(*) > 1;
36
37
      Step 4. The duplication of columns with rows are return
                  providername
39
      ukprn
                                                                                                                              | count

                                                                                           | Yorkshire and the Humber
      (more duplication data found in columns are not shown.....)
```

LISTING B.6: Identify row uniqueness

In this section, PostgreSQL query is executed on a terminal to identify duplicates data found in specific columns. The result shows the count of duplication data found in selected columns and lists out in tabular form. This method is proved to be able to identify data duplication occurs within a column.

## Appendix C

# Golang programming for import CSV into PostgreSQL database

#### C.1 Introduction

The Go Programming Language possess package csv to reads and write comma-separated values (CSV) files. The package will automatically ignore whitespace, blank lines and delimits commas to read data. In addition, the language also contains a driver to perform CRUD transaction on PostgreSQL database.

The program below imports 100 rows of company data, LEO data and NSPL data from CSV files to PostgreSQL database. Five columns of data are selected from each file to import into this program as proof of concept in this project. The tables will be created in PostgreSQL database before the program is executed.

#### C.1.1 LEO table for data importation

LISTING C.1: PostgreSQL query for LEO table creation.

#### C.1.2 NSPL table for data importation

LISTING C.2: PostgreSQL query for NSPL table creation.

#### C.1.3 LEO table for data importation

LISTING C.3: PostgreSQL query for Company table creation.

#### C.1.4 Source code of Go program

```
package main

  \begin{array}{c}
